### **Executive Summary**

- 1. The proposed Riffles Food Cart development will include the construction of a food cart facility, to be located within the Twin Cedars Center shopping center at 37133/37115 Highway 26 in Sandy, Oregon. Specifically, the project includes constructing 18 food cart pods, a 3,600 square foot building intended as a common dining space, and off-street parking. Access to the site will be available via existing shopping center driveways along US-26.
- 2. The trip generation calculations show that the proposed project is projected to generate 12 net new morning peak hour trips, 57 net new evening peak hour trips, and 566 net new average weekday trips.
- 3. No significant trends or crash patterns were identified at any of the study intersections that were indicative of safety concerns. In addition, none of the study intersections exhibit crash rates near or above the 1.00 CMEV threshold nor do any of the study intersections have a crash rate exceeding ODOT's 90<sup>th</sup> percentile rate. Accordingly, no safety mitigation is recommended per the crash data analysis.
- 4. Due to insufficient main and side street traffic volumes, traffic signal warrants are not projected to be met at the full-movement shopping center access intersection at US-26 under year 2023 buildout conditions.
- 5. All study intersections are currently operating acceptably per ODOT standards and are projected to continue operating acceptably through the 2023 site buildout year. No operational mitigation is necessary or recommended at these intersections.

### **Project Description**

#### Introduction

The proposed Riffles Food Cart development will include the construction of a food cart facility, to be located within the Twin Cedars Center shopping center at 37133/37115 Highway 26 in Sandy, Oregon. Specifically, the project includes constructing 18 food cart pods, a 3,600 square foot building intended as a common dining space, and off-street parking. Access to the site will be available via existing shopping center driveways along Highway 26 (US-26).

Based on correspondence with City of Sandy's transportation consultant and Oregon Department of Transportation (ODOT) staff, the report conducts safety and capacity/level of service analyses at the following intersections during the morning and evening peak hours:

- 1. Industrial Way at US-26; and
- 2. Shopping center access (full-movement access) at US-26.

The purpose of this study is to determine whether the transportation system within the vicinity of the site is capable of safely and efficiently supporting the existing and proposed uses, and to determine any mitigation that may be necessary to do so. Detailed information on traffic counts, trip generation calculations, safety analyses, and level of service calculations is included in the appendix to this report.

### Location Description

The project site is located north of US-26, east of Industrial Way, and west of Kate Schmitz Avenue within the Twin Cedars Center shopping center in Sandy, Oregon. The site consists of two properties (tax lots 1000 and 1200) which encompass an approximate total of 2.16 acres. In the immediate vicinity, the site is surrounded by a mix of uses including a fitness gym to the north, medical office/restaurant/coffee shop to the south, forested land to the east, and car service uses to the west.

Figure 1 presents an aerial image of the nearby vicinity with the project site outlined in yellow.

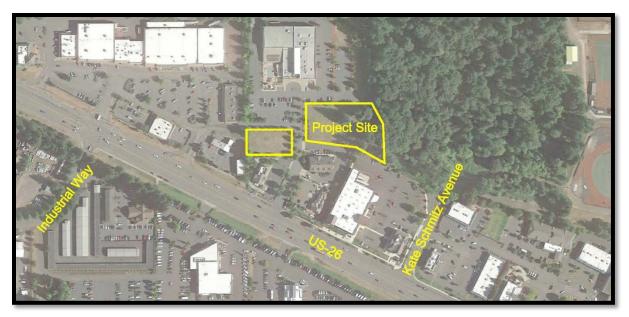

Figure 1: Aerial Photo of Site Vicinity (Image from Google Earth)

#### Vicinity Streets

The proposed development is expected to impact two roadways near the site. Table 1 provides a description of each vicinity roadway.

**Table 1: Vicinity Roadway Descriptions** 

Street Name	Jurisdiction	Functional Classification	Speed (MPH)	On-Street Parking	Curbs & Sidewalks	Bicycle Lanes
US-26	ODOT	Arterial/ Statewide Hwy	40/45	Not Permitted	Partial Both Sides	Both Sides
Industrial Way	City of Sandy	Collector	25	Partially Permitted	Partial Both Sides	None

Table Notes: Functional classification based on City of Sandy TSP and ODOT OHP.

#### **Study Intersections**

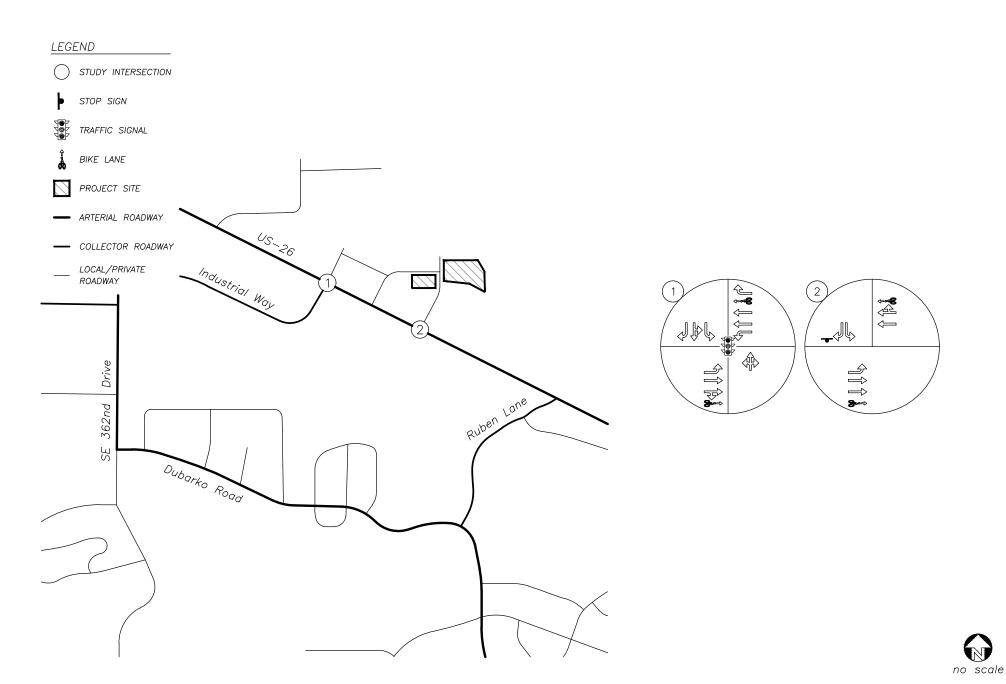

Based on coordination with agency staff, two existing intersections were identified for analysis. A summarized description of these study intersections, under their existing lane configurations, is provided in Table 2.

**Table 2: Study Intersection Descriptions** 

Number	Intersection	Geometry	Traffic Control	Phasing/Stopped Approaches
1	Industrial Way at US-26	Four-Legged	Traffic Signal	FYA EB/WB Left-turns, Split NB/SB Phasing
2	SE 2nd Street at Havlik Drive	Three-Legged	Stop- Controlled	Stop-Controlled SB Approach

A vicinity map showing the project site, vicinity streets, and study intersection configurations is shown in Figure 2.

### **Site Trips**

## Trip Generation

The Riffles Food Cart development will include the construction of 18 food cart pods. To estimate the number of trips that will be generated by the proposed use, trip rates from the *Trip Generation Manual*<sup>1</sup> were used. Specifically, data from land use code 926, *Food Cart Pod*, was used based on the number of food carts.

Due to the limited data available for land use code 926, trip generation data specific to the following are not available:

- Directional distribution of trips (i.e. entering and exiting trips).
- Morning peak hour trip generation.
- Average daily trip (ADT) generation.
- Pass-by trip generation.

#### **Direction Distribution of Trips**

Food cart facilities typically serve patrons seeking quick and convenient food service, but who are expecting a higher quality and price point for food than a typical fast-food restaurant. In the *Trip Generation Manual*, the closest land use code that matches this type of facility that has directional data is land use code 930, *Fast Casual Restaurant*. For the purposes of estimating trip generation, it is assumed that the directional split of trips to/from the site would approximately match the splits from land use code 930. The following directional splits were assumed:

- Morning peak hour: 50 percent entering, 50 percent exiting.
- Evening peak hour: 55 percent entering, 45 percent exiting.

#### Morning Peak Hour Trip Generation

Proprietors of food carts typically open for business during the late morning hours to capture the lunch peak and often do not open from 7:00 AM to 9:00 AM. Therefore, trip generation from the facility is expected to be low during these hours. For the purposes of this analysis, it is assumed that a conservative 20 percent of the food carts may be in operation, whereby the trip generation for the morning peak hour was assumed to be approximately 1.23 trips per cart.

#### **Average Daily Trip Generation**

To estimate the ADT of the proposed food cart facility, it is assumed the daily trip generation would be approximately 10 times the evening peak hour rate.

#### **Pass-by Trip Generation**

Generally, food service land uses are expected to attract pass-by trips (i.e. draw existing traffic volumes along adjacent roadways to the site). Although, pass-by data is not available for land use code 926 in the *Trip Generation Manual*, this is not indicative that no pass-by trips are occurring, instead the data in the manual may

<sup>&</sup>lt;sup>1</sup> Institute of Transportation Engineers (ITE), *Trip Generation Manual*, 11<sup>th</sup> Edition, 2021.

be limited or incomplete. Below are examples of food service land uses that provide pass-by trip data and those that do not:

- Land uses with Pass-by Trip Data
  - o 931 Fine Dining: 44 percent (based on 4 studies).
  - o 932 High-Turnover (Sit-Down) Restaurant: 43 percent (based on 12 studies).
  - o 934 Fast-Food Restaurant with Drive-Through Window: AM = 50 percent, PM = 55 percent (based on 5 studies and 11 studies, respectively).
  - o 935 Fast-Food Restaurant without Drive-Through Window and No Indoor Seating: 31 percent (based on 2 studies).
- Land uses without Pass-by Trip Data
  - o 930 Fast Casual Restaurant
  - o 933 Fast-Food Restaurant without Drive-Through Window

It should also be noted that at times similar land uses in the ITE manual will only provide pass-by trip data for one specific land use type. An example of this would include codes 934 and 935 having pass-by trip data, but code 933 lacking data (all of which are fast-food restaurants). In cases when land uses analyzed under code 933 is studied, often pass-by trip data is assumed to match data from code 934, noting pass-by data from code 935 is based on a smaller sample size of studies.

Given the above, it is reasonable to assume food carts would also generate pass-by trips. Since food cart facilities typically serve patrons seeking quick and convenient food service (like a fast-food restaurant) but are expecting higher quality/prices for food without table service, it is assumed the pass-by trip generation of such a facility would be between that of land use codes 932 and 934. Therefore, it is assumed the proposed food cart facility will have a pass-by rate of approximately 46 percent and 49 percent during the morning and evening peak hours, respectively (the average of land use codes 932 and 934).

#### **Analysis Results**

Based on the above assumptions, the trip generation calculations show that the proposed project is projected to generate 12 net new morning peak hour trips, 57 net new evening peak hour trips, and 566 net new average weekday trips. The trip generation estimates are summarized in Table 3. Detailed trip generation calculations are in the technical appendix to this report.

**Table 3: Trip Generation Summary** 

	ITE Code	Size/Rate	Morni	ng Peak	Hour	Evenir	ng Peak	Hour	Weekday
	TTE Code	Size/Rate	Enter	Exit	Total	Enter	Exit	Total	Total
Food Cart Pod	926	18 carts	11	11	22	61	50	111	1,108
Pass-by Trips	-	46% (49%)	5	5	10	27	27	54	542
Primary Trips (Net New Trips)			6	6	12	34	23	57	566

Table Notes: AM peak hour, PM peak hour, and daily trip rates denoted as AM (PM/ADT).

### Trip Distribution

The directional distribution of site trips to/from the project site was estimated based on the locations of likely trip destinations, locations of major transportation facilities in the site vicinity, and existing travel patterns at the study intersections.

The following trip distribution is projected:

- Approximately 50 percent of site trips will travel to/from the east along US-26;
- Approximately 45 percent of site trips will travel to/from the west along US-26; and
- Approximately 5 percent of site trips will travel to/from the south along Industrial Way.

During the peak hours of adjacent street traffic along US-26, it is expected that during periods of high congestion locals familiar with the area may utilize nearby signalized intersections in lieu of stop-controlled intersections when conducting left-turns onto the highway. Therefore, for the purposes of this analysis it is assumed that approximately half of the egressing site trips traveling to the east along US-26 will utilize the signalized intersection of Industrial Way at US-26.

The trip distribution and assignment for the site trips generated during the morning and evening peak hours is shown in Figure 3 and Figure 4, respectively.

### **Traffic Volumes**

### **Existing Conditions**

Due to the ongoing COVID-19 viral pandemic, traffic volumes around Oregon have been depressed relative to normal conditions. A review of available traffic count data yielded annual average daily traffic (AADT) along US-26, just west of SE 362<sup>nd</sup> Avenue and west of Bluff Road per ODOT's 2019 Transportation Volume Tables. Given this available count data, the following methodology for data collection and volume adjustment is suggested:

- The historical AADT traffic counts at both locations along US-26 from 2019 were grown to reflect 2021
  existing conditions by applying an average linear growth rate of 1.9476 percent per year over a twoyear period in accordance with ODOT's Future Volumes Table.
- Since recent/historical traffic counts are not available at the study intersections, current year 2021 morning and evening peak hour counts were collected at both study intersections. These counts were collected on Tuesday, July 13, 2021, from 6:00 AM to 9:00 AM and from 3:00 PM to 6:00 PM.
- The 2019 historical count data (grown to reflect 2021 conditions) and the recently collected 2021 evening peak hour counts at the shopping center access intersection along US-26, located approximately mid-way between the two ODOT count locations, were compared. Specifically, it is assumed that the evening peak hour counts represent approximately ten percent of annual average daily traffic (AADT). Based on the difference in traffic volumes, an adjustment factor of 1.1952 was calculated. This adjustment factor is intended to estimate normal traffic conditions without impacts from the COVID-19 virus (i.e. normal commuter patterns, businesses open, etc).
- The calculated adjustment factor was applied to the collected 2021 morning and evening peak hour intersection traffic counts.

Data was used from each intersection's respective morning and evening peak hours. Note the City of Sandy utilizes alternative mobility standards for intersections along US-26 which include analyzing the average annual weekday peak hour in lieu of the 30<sup>th</sup> highest hour. Therefore, the method of adjusting counts to address COVID-19 impacts by comparing volumes with the highway's AADT by default takes this alternative standard into consideration.

Figure 5 shows the existing traffic volumes at the study intersections during the morning and evening peak hours.

## **Background Conditions**

To provide analysis of the impact of the proposed development on the nearby transportation facilities, an estimate of future traffic volumes is required. In order to approximate the future year 2023 traffic volumes at the study intersections, an average linear growth rate of 1.9476 percent per year over a two-year period in was applied to the measured through movement traffic volumes along US-26. For minor-street turning movements, a local compounded growth rate of two percent per year over a two-year period was applied.

Figure 6 shows the projected year 2023 background traffic volumes at the study intersections during the morning and evening peak hours.

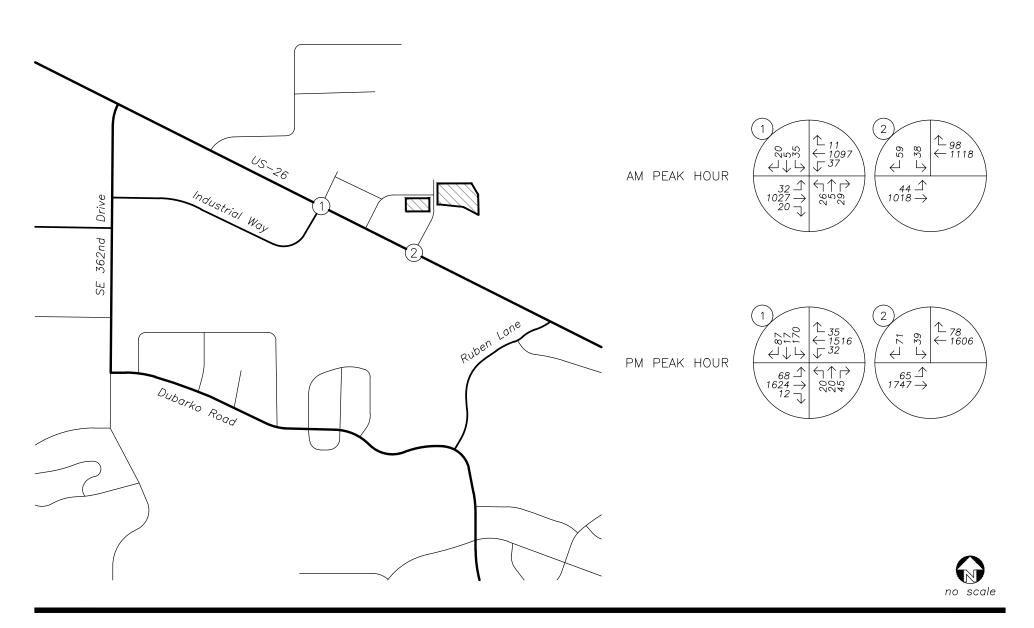

### **Buildout Conditions**

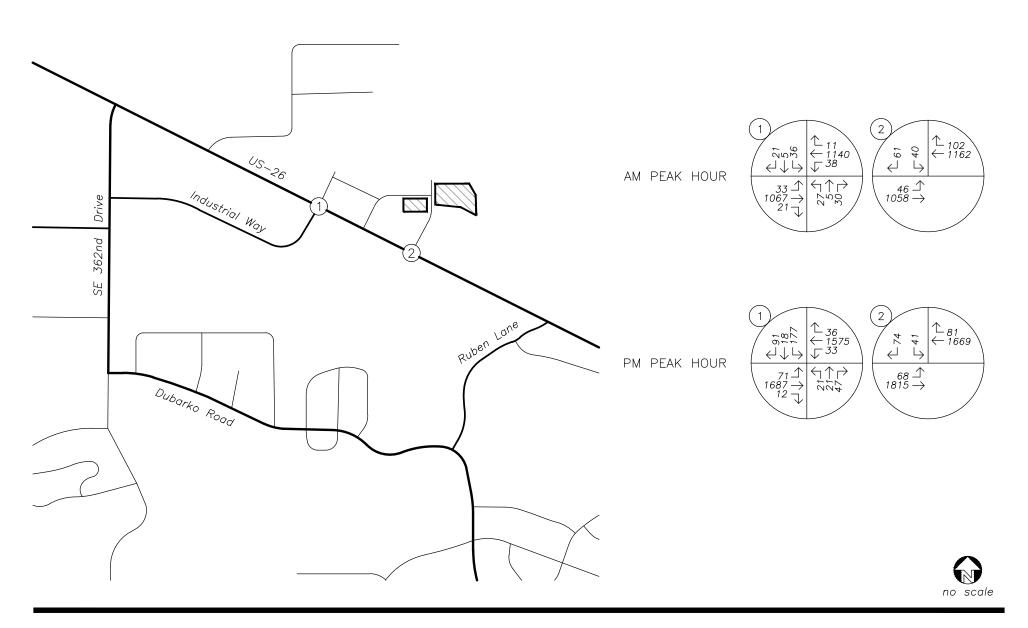

Peak hour trips calculated to be generated by the proposed development, as described earlier within the *Site Trips* section, were added to the projected year 2023 background traffic volumes to obtain the expected 2023 site buildout volumes.

Figure 7 shows year 2023 buildout traffic volumes at the study intersections during the morning and evening peak hours.

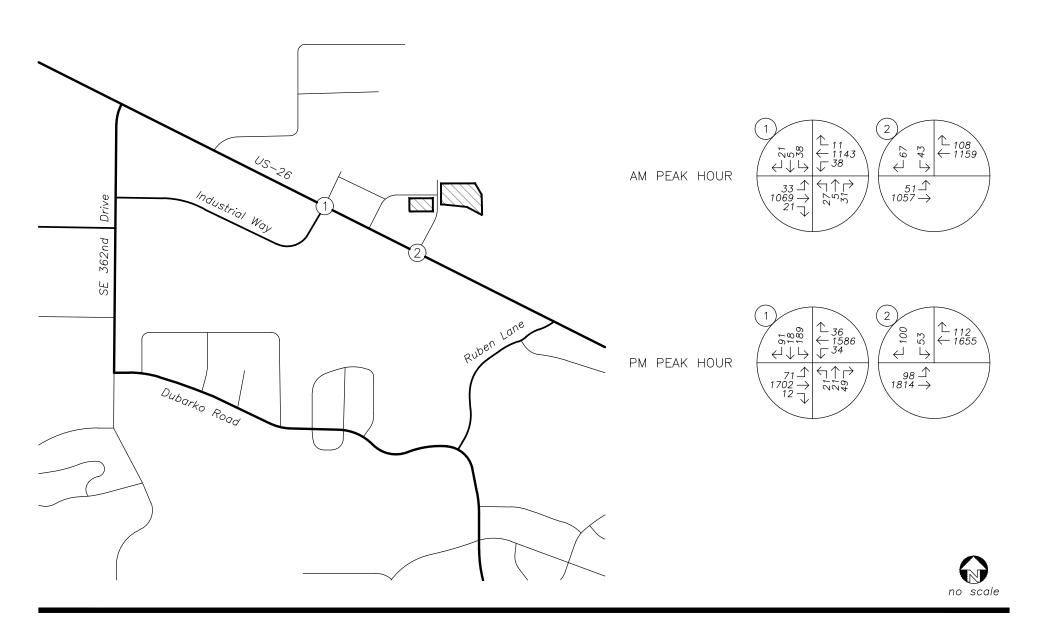

### Safety Analysis

## Crash History Review

Using data obtained from ODOT's Crash Analysis and Reporting Unit, a review was performed of the most recent five years of available crash data at the study intersections (January 2015 through December 2019). The crash data was evaluated based on the number of crashes, the type of collisions, the severity of the collisions, and the resulting crash rate for each intersection. Crash rates provide the ability to compare safety risks at different intersections by accounting for both the number of crashes that have occurred during the study period and the number of vehicles that typically travel through the intersection. Crash rates were calculated under the common assumption that traffic counted during the evening peak hour represents approximately ten percent of annual average daily traffic (AADT) at each intersection. Crash rates in excess of 1.00 crashes per million entering vehicles (CMEV) may be indicative of design deficiencies and therefore require a need for further investigation and possible mitigation.

With regard to crash severity, ODOT classifies crashes in the following categories:

- Property Damage Only (PDO);
- Possible Injury Complaint of Pain (Injury C);
- Non-Incapacitating Injury (Injury B);
- Incapacitating Injury Bleeding, Broken Bones (Injury A); and
- Fatality or Fatal Injury.

The study intersections along US-26 are ODOT facilities which adhere to the crash analysis methodologies in ODOT's APM. According to *Exhibit 4-1: Intersection Crash Rates per MEV by Land Type and Traffic Control* of the APM, intersections which experience crash rates in excess of their respective 90<sup>th</sup> percentile crash rates should be "flagged for further analysis". For intersections in urban settings, the following average and 90<sup>th</sup> percentile rates are applicable to the study intersections:

- Signalized, Four-Legged Intersections:
  - o Average rate of 0.477 CMEV.
  - o 90<sup>th</sup> percentile rate of 0.860 CMEV.
- Unsignalized, Three-Legged Intersections:
  - o Average rate of 0.131 CMEV.
  - o 90<sup>th</sup> percentile rate of 0.293 CMEV.

Table 4 provides a summary of crash types while Table 5 summarizes crash severities and rates for each of the study intersections. Detailed crash data is provided in the appendix to this report.

**Table 4: Crash Type Summary** 

		Crash Type								
Number	Number Intersection		Turn/ Angle	Fixed Object	Side swipe	Ped/ Bike	Other	Total		
1	Industrial Way at US- 26	21	7	0	1	1	1	31		
2	Shopping Center Access at US-26	0	2	0	0	0	0	2		

Table 5: Crash Severity and Rate Summary

				Cras	sh Sev	Total		Crash		
Number		PDO	С	В	Α	Fatal	Unknown	Crashes	AADT	Rate
1	Industrial Way at US- 26	11	16	4	0	0	0	31	36,460	0.47
2	Shopping Center Access at US-26	2	0	0	0	0	0	2	36,060	0.03

Table Notes: **BOLDED** text indicates a crash rate in excess of 1.00 CMEV.

There was one reported crash at the intersection of Industrial Way at US-26 that involved a pedestrian. The crash occurred when a north/south crossing pedestrian illegally entered the intersection in the roadway (not crosswalk) and was struck by a westbound passenger car. The pedestrian sustained injuries consistent with Injury B classification while the driver of the vehicle was uninjured.

Based on the review of the available crash data, no significant trends or crash patterns were identified at any of the study intersections that were indicative of safety concerns. In addition, none of the study intersections exhibit crash rates near or above the 1.00 CMEV threshold nor do any of the study intersections have a crash rate exceeding ODOT's 90<sup>th</sup> percentile rate. Accordingly, no safety mitigation is recommended per the crash data analysis.

# Traffic Signal Warrants

Preliminary traffic signal warrants were examined for the shopping center access at US-26 to determine whether the installation of a new traffic signal will be warranted at the intersection upon completion of the proposed development. Due to insufficient main and side street traffic volumes, traffic signal warrants are not projected to be met at the intersection under year 2023 buildout conditions.

# **Operational Analysis**

## Intersection Capacity Analysis

A capacity and delay analysis were conducted for each of the study intersections per the signalized and unsignalized intersection analysis methodologies in the *Highway Capacity Manual* (HCM)<sup>2</sup>. Intersections are generally evaluated based on the average control delay experienced by vehicles and are assigned a grade according to their operation. The level of service (LOS) of an intersection can range from LOS A, which indicates very little or no delay experienced by vehicles, to LOS F, which indicates a high degree of congestion and delay. The volume-to-capacity (v/c) ratio is a measure that compares the traffic volumes (demand) against the available capacity of an intersection.

### Performance Standards

The operating standards adopted by the City of Sandy and ODOT are summarized below.

#### City of Sandy

According to the City of Sandy's Transportation System Plan (TSP), both signalized and unsignalized intersections are required to operate at LOS D or better<sup>3</sup>.

#### **ODOT**

Per the City's TSP and the City's June 2011 *Alternate Mobility Standards Report*, alternative mobility standards which include utilizing a v/c ratio of 0.85 are applicable to signalized intersections along the segment of US-26 between Orient Drive to Ten Eyck Road.

At unsignalized intersections and road approaches along US-26, the v/c ratios shall not exceed 0.90 per the Oregon Highway Plan's Table 6 for District/Local Interest Roads within the urban growth boundary.

# Delay & Capacity Analysis

The LOS, delay, and v/c results of the capacity analysis are shown in Table 6 for the morning and evening peak hours. The TrafficWare Synchro software utilized for analysis does not report the overall v/c ratio of signalized intersections in the HCM 6<sup>th</sup> Edition capacity reports. For these intersections, the v/c ratio was calculated based on methods detailed in ODOT's APM *Section 13 Signalized Intersection Analysis*. Detailed calculations as well as tables showing the relationship between delay and LOS are included in the appendix to this report.

<sup>&</sup>lt;sup>3</sup> City of Sandy, Sandy Transportation System Plan. December 2011.

<sup>&</sup>lt;sup>2</sup> Transportation Research Board, *Highway Capacity Manual 6<sup>th</sup> Edition*, 2016.

Table 6: Capacity Analysis Summary

		AM Peak Hour			P	M Peak Hou	ır
		LOS	Delay (s)	v/c	LOS	Delay (s)	v/c
		1. Industria	al Way at U	S-26			
2021 Existing Conditions		А	9	0.53	В	17	0.73
2023 Background Conditions		А	9	0.55	В	18	0.76
2023 Buildout Conditions		А	9	0.56	В	19	0.77
2	. Sh	opping Ce	nter Access	at US-26			
2021 Existing Conditions		D	31	0.23	F	72	0.44
2023 Background Conditions		D	34	0.26	F	89	0.52
2023 Buildout Conditions		D	35	0.28	F	>120	0.77

Table Notes: **BOLDED** text indicates interseciton operation above jurisdictional standards.

Based on the results of the operational analysis, both study intersections are currently operating acceptably per ODOT standards and are projected to continue operating acceptably through the 2023 site buildout year. No operational mitigation is necessary or recommended at these intersections.

### **Conclusions**

No significant trends or crash patterns were identified at any of the study intersections that were indicative of safety concerns. In addition, none of the study intersections exhibit crash rates near or above the 1.00 CMEV threshold nor do any of the study intersections have a crash rate exceeding ODOT's 90<sup>th</sup> percentile rate. Accordingly, no safety mitigation is recommended per the crash data analysis.

Due to insufficient main and side street traffic volumes, traffic signal warrants are not projected to be met at the full-movement shopping center access intersection at US-26 under year 2023 buildout conditions.

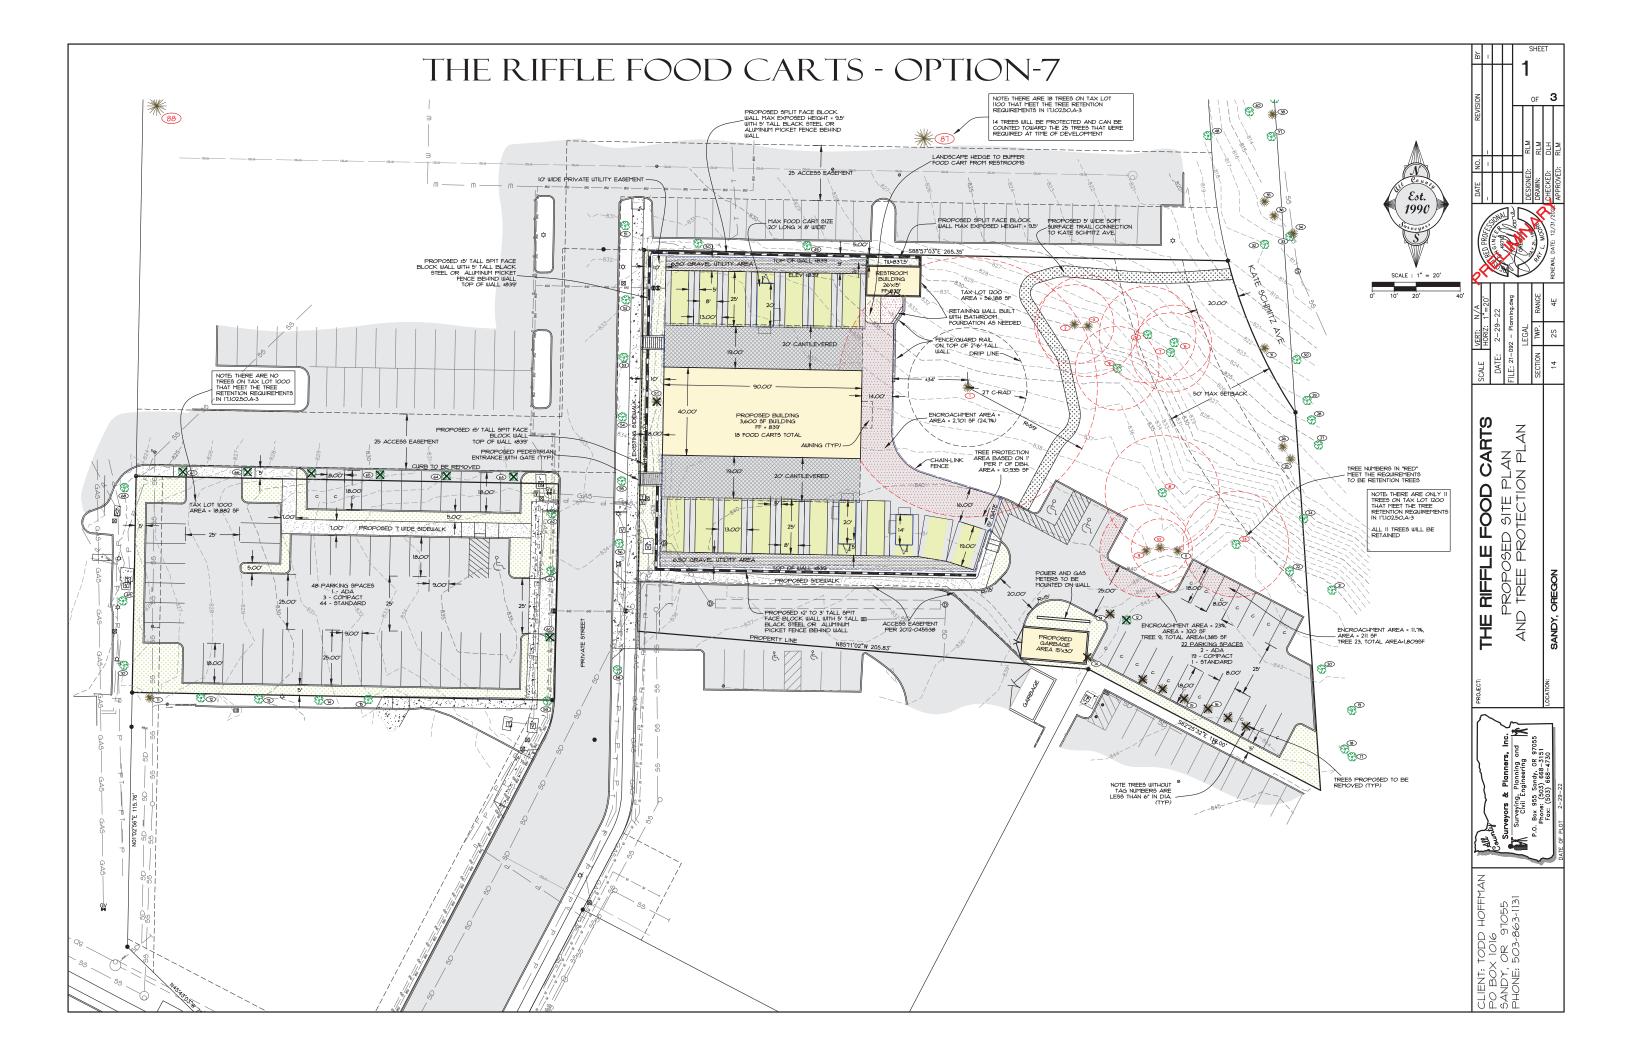

All study intersections are currently operating acceptably per ODOT standards and are projected to continue operating acceptably through the 2023 site buildout year. No operational mitigation is necessary or recommended at these intersections.

Traffic Signal Warrants

## **Traffic Signal Warrant Analysis**

Project: The Riffles Food Carts

Date: 3/7/2022

Scenario: 2023 Buildout Conditions

Major Street: US-26 Minor Street: Shopping Center Access

Number of Lanes: 2 Number of Lanes: 1

PM Peak Hour Volumes: PM Peak Hour Volumes: 69

Warrant Used:

X 100 percent of standard warrants used

70 percent of standard warrants used due to 85th percentile speed in excess of 40 mph or isolated community with population less than 10,000.

Number o	of Lanes for Moving	ADT on	Major St.	ADT on I	Minor St.
Traffic o	n Each Approach:	(total of both	approaches)	(higher-volun	ne approach)
WARRANT 1, CO	ONDITION A	100%	70%	100%	70%
Major St.	Minor St.	<u>Warrants</u>	<u>Warrants</u>	<u>Warrants</u>	<u>Warrants</u>
1	1	8,850	6,200	2,650	1,850
2 or more	1	10,600	7,400	2,650	1,850
2 or more	2 or more	10,600	7,400	3,550	2,500
1	2 or more	8,850	6,200	3,550	2,500
WARRANT 1, CO	ONDITION B				
1	1	13,300	9,300	1,350	950
2 or more	1	15,900	11,100	1,350	950
2 or more	2 or more	15,900	11,100	1,750	1,250
1	2 or more	13,300	9,300	1,750	1,250

Note: ADT volumes assume 8th highest hour is 5.6% of the daily volume

	Approach Volumes	Minimum Volumes	Is Signal Warrant Met?
Warrant 1			
Condition A: Minimum Vehicular Volume	•		
Major Street	36,790	10,600	
Minor Street*	690	2,650	No
Condition B: Interruption of Continuous	Traffic		
Major Street	36,790	15,900	
Minor Street*	690	1,350	No
Combination Warrant			
Major Street	36,790	12,720	
Minor Street*	690	2,120	No

Note: Minor street right-turning traffic volumes reduced by 85% of the right-turn capacity.

# Appendix F

Level of Service Descriptions

Capacity Reports

#### LEVEL OF SERVICE

Level of service is used to describe the quality of traffic flow. Levels of service A to C are considered good, and rural roads are usually designed for level of service C. Urban streets and signalized intersections are typically designed for level of service D. Level of service E is considered to be the limit of acceptable delay. For unsignalized intersections, level of service E is generally considered acceptable. Here is a more complete description of levels of service:

Level of service A: Very low delay at intersections, with all traffic signal cycles clearing and no vehicles waiting through more than one signal cycle. On highways, low volume and high speeds, with speeds not restricted by other vehicles.

Level of service B: Operating speeds beginning to be affected by other traffic; short traffic delays at intersections. Higher average intersection delay than for level of service A resulting from more vehicles stopping.

Level of service C: Operating speeds and maneuverability closely controlled by other traffic; higher delays at intersections than for level of service B due to a significant number of vehicles stopping. Not all signal cycles clear the waiting vehicles. This is the recommended design standard for rural highways.

Level of service D: Tolerable operating speeds; long traffic delays occur at intersections. The influence of congestion is noticeable. At traffic signals many vehicles stop, and the proportion of vehicles not stopping declines. The number of signal cycle failures, for which vehicles must wait through more than one signal cycle, are noticeable. This is typically the design level for urban signalized intersections.

Level of service E: Restricted speeds, very long traffic delays at traffic signals, and traffic volumes near capacity. Flow is unstable so that any interruption, no matter how minor, will cause queues to form and service to deteriorate to level of service F. Traffic signal cycle failures are frequent occurrences. For unsignalized intersections, level of service E or better is generally considered acceptable.

Level of service F: Extreme delays, resulting in long queues which may interfere with other traffic movements. There may be stoppages of long duration, and speeds may drop to zero. There may be frequent signal cycle failures. Level of service F will typically result when vehicle arrival rates are greater than capacity. It is considered unacceptable by most drivers.

## LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS

#### Notes:

Since EB and WB left-turn phases are protected, critical ring is either EBL+WBT or WBL+EBT - HCM6 does not show reductions for permitted left turns

Since NB and SB left-turn phases are Split, critical ring is max of NB lane groups + max of SB lane groups

0.57
